#### Abstract

An Expression for the expected value of the intersection of a sure sphere and a random sphere has been derived by Laurent (1974). In the present paper we derive the expression for the expected intersection volume of a sure ellipsoid and a random ellipsoid.

Keywords and phrases: Expected value; Sure ellipsoid; Random field; Noncentral Chi square distribution; Bessel function

## 1. Introduction

We follow the notation and terminology of Laurent (1974). Let $S_{0}$ be a fixed $n$ dimensional ellipsoid with the equation $x^{\prime} \Delta x \leq r^{2}$, where $n \times n \Delta$ is positive definite symmetric and $r$ is known. Let the center $C$, with coordinates $\xi$ of an n-dimensional ellipsoid S follow an elliptically symmetric distribution about the fixed center A, with coordinates $\eta$, i.e., the density of $\xi$ is of the type $g_{\mathrm{n}}\left(\mathrm{y}^{\prime} \Delta \mathrm{y}\right), \mathrm{y}=(\xi-\eta)$. We wish to obtain an expression for $\mu_{\mathrm{n}}=\mathrm{E}\left[\mathrm{V}\left(\mathrm{S}_{0} \cap \mathrm{~S}\right)\right]$, the expected intersection volume contained in $S_{0}$ and $S$, where $S$ denotes the volume $y^{\prime} \Delta y \leq R^{2}, R$ known.

Let m be the coordinates of a random point M inside this intersection. Then from Laurent (1974, p. 183, equation (4)) we have

$$
\begin{align*}
\mu_{\mathrm{n}}= & \int_{\mathrm{m}^{\prime} \Delta \mathrm{m} \leq \mathrm{r}^{2}}\left[\int_{(\xi-\mathrm{n})^{\prime} \Delta(\xi-\mathrm{nr}) \leq \mathrm{R}^{2}} g_{\mathrm{n}}\left(\mathrm{y}^{\prime} \Delta \mathrm{y}\right) \mathrm{dy}\right] \mathrm{dm} \\
& =\int \mathrm{I}_{\mathrm{S}_{0}}\left[\int \mathrm{I}_{\mathrm{S}_{0}} g_{\mathrm{n}}\left(\mathrm{y}^{\prime} \Delta \mathrm{y}\right) \mathrm{dy}\right] \mathrm{dm} \tag{1}
\end{align*}
$$

where the integral inside the square brackets represents $\mathrm{P}\left\{(\xi-\mathrm{m})^{\prime} \Delta(\xi-\mathrm{m}) \leq \mathrm{R}^{2}\right\}$. $\mathrm{I}_{\mathrm{S}}$ denotes the indicator function of the set $\mathrm{I}_{S}\left(\mathrm{~m} ; \xi \mathrm{R}^{2}\right)$, and $\mathrm{I}_{\mathrm{S}_{0}}$ is the indicator function of the set $\mathrm{I}_{\mathrm{s}_{0}}\left(\mathrm{~m}, \mathrm{r}^{2}\right)$. Note that $\mathrm{y}^{\prime} \Delta \mathrm{y} \leq \mathrm{R}^{2}$ implies $(\xi-\mathrm{m})^{\prime} \Delta(\xi-\mathrm{m}) \leq \mathrm{R}^{2}$. For a fixed m , and normal $\xi$ we know that $\rho^{2}=(\xi-\mathrm{m})^{\prime} \Delta(\xi-\mathrm{m})$ follows a noncentral $\chi^{2}$ distribution with n degrees of freedom and noncontrality parameter $\delta^{2}=(m-\eta)^{\prime} \Delta(\mathrm{m}-\eta)$ (Muirhead, 2005). This noncentral distribution can be expressed in terms of a Bessel function of first kind and order $(\mathrm{n}-2) / 2$. (Abramowitz and Stegun, 1972). Obviously, $\mathrm{P}\left\{(\xi-\mathrm{m})^{\prime} \Delta(\xi-\mathrm{m}) \leq \mathrm{R}^{2}\right\}$ depends on M only through $\delta^{2}$. Let us denote the distribution
function of $\rho^{2}$. i.e. $P\left\{\rho^{2} \leq R^{2}\right\}$ by $\mathrm{Q}_{n}\left(\mathrm{R}^{2} ; \delta^{2}\right)$ and its density function by $\mathrm{q}_{\mathrm{n}}\left(\rho^{2} ; \delta^{2}\right)$. Thus the equation (1) now becomes

$$
\begin{equation*}
\mu_{\mathrm{n}}=\int \mathrm{Q}_{\mathrm{n}}\left(\mathrm{R}^{2} ; \delta^{2}\right) \mathrm{I}_{\mathrm{S}_{0}} \mathrm{dm}=\int_{\mathrm{n}^{\prime} \Delta \mathrm{n} \leq \mathrm{r}^{2}} \mathrm{Q}_{\mathrm{n}}\left(\mathrm{R}^{2} ; \delta^{2}\right) \mathrm{dm} \tag{2}
\end{equation*}
$$

We proceed to evaluate (2) in the next section. We first note that the random variable $(\xi-\mathrm{m})^{\prime} \Delta(\xi-\mathrm{m})$, for a fixed m , has a noncentral $\chi^{2}$ type density. This density is necessary to evaluate the first integral in (1). Next the andom variable $\mathrm{m}^{\prime} \Delta \mathrm{m}$ also has anoncentral $\chi^{2}$ type density with noncentrality parameter $\eta^{\prime} \Delta \eta$. Thus the final result depends only on $\mathrm{r}, \mathrm{R}, \eta^{\prime} \Delta \eta$, and $\Delta$. The final result involves three Bessel functions of the first kind. The first Bessel function appears in the noncentral $\chi^{2}$ type density of $(\xi-\mu)^{\prime} \Delta(\xi-m)$. The second Bessel function appears because the integration involves integration over a certain angle. The third Bessel function appears in the noncentral $\chi^{2}$ type density of $\mathrm{m}^{\prime} \Delta \mathrm{m}$.

## 2. The squared noncentral radical error distribution

As in Laurent (1974), we get $(y-\eta)^{\prime} \Delta(y-\eta)=|y|^{2},|y|=\left[(y-\eta)^{\prime} \Delta(y-\eta)\right]^{1^{\prime 2}}$, $\delta^{2}=(m-\eta)^{\prime} \Delta(m-\eta), \delta=\left[(m-\eta)^{\prime} \Delta(m-\eta)\right]^{1^{\prime 2}},|y|>0, \delta>0$, and

$$
\begin{equation*}
\rho^{2}=|y|^{2}+\delta^{2}-2(m-\eta)^{\prime} \Delta(m-\eta)=|y|^{2}+\delta^{2}-2|y| \delta \cos \varphi, \tag{3}
\end{equation*}
$$

where $\cos \varphi=(m-\eta)^{\prime} \Delta(m-\eta) / \mid y l \delta$.
The characteristic function of an elliptically symmetric distribution (Gupta and Varga, 1993) is given by

$$
\begin{align*}
\int_{-\alpha}^{\alpha} \exp \left\{i t^{\prime} \Delta y\right\} f\left(y^{\prime} \Delta y\right) d y & =K|\Delta|^{-\frac{1}{2}} f(u) u^{\frac{\mathrm{n}-2}{2}} \int_{-1}^{1} \exp \left\{i \sqrt{\mathrm{u}} \sqrt{\mathrm{t}^{\prime} \Delta \mathrm{t} v}\right\}\left(1-\mathrm{v}^{2}\right)^{\frac{\mathrm{n}-3}{2}} d v \\
= & K|\Delta|^{-\frac{1}{2} f}(\mathrm{u}) u^{\frac{\mathrm{n}-2}{2}} \int_{-\pi}^{\pi} \exp \left\{i v \bar{u} \sqrt{\mathrm{t}^{\prime} \Delta \mathrm{t}} \cos \varphi\right\} \sin ^{\mathrm{n}-2} \varphi d \varphi \\
& =K|\Delta|^{-\frac{1}{2}} \mathrm{f}(\mathrm{u}) u^{\frac{\mathrm{n}-2}{2}} \frac{\mathrm{~J}_{\mathrm{n}-2}}{2}\left(\sqrt{\mathrm{u}} \sqrt{\mathrm{t}^{\prime} \Delta \mathrm{t}}\right) \tag{4}
\end{align*}
$$

where $\cos \varphi=\mathrm{t}^{\prime} \Delta \mathrm{y} /\left(\mathrm{t}^{\prime} \Delta \mathrm{t}\right)^{1 / 2}\left(\mathrm{y}^{\prime} \Delta \mathrm{y}\right)^{1 / 2}$,

$$
\mathrm{J}_{\mathrm{n}}(\mathrm{x})=\frac{1}{\Gamma(\mathrm{n}+1)}-\left(\frac{\mathrm{x}}{2}\right)^{\mathrm{n}}{ }_{0} \mathrm{~F}_{1}\left(\mathrm{n}-1,-\frac{1}{4} \mathrm{x}^{2}\right)
$$

and K denotes constant terms. Here $\mathrm{J}_{\mathrm{n}}(\mathrm{x})$ is the Bessel function of the first kind defined in terms of the confluent hypergeometric function ${ }_{0} F_{1}(\cdot)$.Thus the integral (4) depends on only one angle $\varphi$.

## Intersection of a Sure Ellipsoid and a Random Ellipsoid

Now Laurent (1974) shows that the evaluation of $\mathrm{Q}_{\mathrm{n}}\left(\mathrm{R}^{2}, \delta^{2} ;|y|^{2}\right)$, i.e., the conditional distribution function of the noncentral radial error $\rho$ depends on only one angle $\varphi$, and is given by

$$
\begin{equation*}
\mathrm{Q}_{\mathrm{n}}\left(\mathrm{R}^{2}, \delta^{2} ;|\mathrm{y}|^{2}\right)=\int_{0}^{\varphi} \sin ^{\mathrm{n}-2} \varphi \mathrm{~d} \varphi / \mathrm{B}\left(\frac{\mathrm{n}-1}{2}, \frac{1}{2}\right), \tag{5}
\end{equation*}
$$

where $\cos \varphi=\left(|y|^{2}+\delta^{2}-R^{2}\right) / 2|y| \delta$. Further (see Laurent (1974, p. 184, equation (8))) we find (5) to be

$$
\begin{equation*}
\mathrm{Q}_{\mathrm{n}}\left(\mathrm{R}^{2}, \delta^{2} ;|\mathrm{y}|^{2}\right)=\Gamma\left(\frac{\mathrm{n}}{2}\right)\left(\frac{2 \mathrm{R}}{|\mathrm{y}| \delta}\right)^{\frac{\mathrm{n}-2}{2}} \mathrm{R} \int_{0}^{\alpha} \mathrm{u}^{\frac{-(\mathrm{n}-2)}{2}} \mathrm{~J}_{\frac{\mathrm{n}-2}{2}}(|y| u) \frac{\mathrm{Jn}}{2}(\mathrm{Ru}) \frac{\mathrm{J}_{\frac{\mathrm{n}-2}{2}}}{}(\delta u) \mathrm{du} . \tag{6}
\end{equation*}
$$

The noncentral density of the squared radial error $\rho^{2}$ is

$$
\begin{equation*}
\mathrm{q}_{\mathrm{n}}\left(\rho^{2} ; \delta^{2} ;|\mathrm{y}|^{2}\right)=\frac{1}{2} \Gamma\left(\frac{\mathrm{n}}{2}\right)\left(\frac{2 \rho}{|\mathrm{y}| \delta}\right)^{\frac{\mathrm{n}-2}{2}} \int_{0}^{\mathrm{a}} \mathrm{u}^{\frac{-(\mathrm{n}-4)}{2}} \mathrm{Jn}_{\frac{\mathrm{n}}{2}}(|y| \mathrm{u}) \frac{\mathrm{J}_{\frac{\mathrm{n}-2}{2}}}{}(\delta u) \mathrm{J}_{\frac{\mathrm{n}-2}{2}}(\rho \mathrm{u}) \mathrm{du} . \tag{7}
\end{equation*}
$$

The result (7) follows by noting that the density of the angle $\varphi$, measured in radians, is given by

$$
\begin{equation*}
g(\varphi)=\frac{1}{\mathrm{~B}\left(\frac{\mathrm{n}-1}{2}, \frac{1}{2}\right)}\left(1-\cos ^{2} \varphi\right)^{\frac{\mathrm{n}-3}{2}},-\pi<\varphi<\pi, \tag{8}
\end{equation*}
$$

and that

$$
\begin{equation*}
\cos \varphi=\frac{|y|^{2}+\delta^{2}-\rho^{2}}{2|y| \delta}, \quad(|y|-\delta)^{2} \leq \rho^{2} \leq(|y|+\delta)^{2} . \tag{9}
\end{equation*}
$$

Hence from (8) and (9), we get the density of $\rho^{2}$, given $|y|^{2}$, as

$$
\begin{equation*}
\mathrm{q}_{\mathrm{n}}\left(\rho^{2}, \delta^{2} ;|\mathrm{y}|^{2}\right)=\frac{(2|y| \delta)^{-(\mathrm{n}-2)}\left[\rho^{2}-(\delta-|y|)^{2}\right]^{\frac{\mathrm{n}-3}{2}}\left[(\delta+|y|)^{2}-\rho^{2}\right]^{\frac{\mathrm{n}-3}{2}}}{B\left(\frac{\mathrm{n}-1}{2}, \frac{1}{2}\right)} \tag{10}
\end{equation*}
$$

The result (10) is given by Laurent (1974, p. 185, equation (10)).
Again from Laurent (1974, p. 185, equation (11)), we have that

$$
\begin{equation*}
\mathrm{Q}_{\mathrm{n}}\left(\mathrm{R}^{2}, \delta^{2}\right)=\int_{0}^{\alpha} \mathrm{Q}_{\mathrm{n}}\left(\mathrm{R}^{2}, \delta^{2} ;|y|^{2}\right) \mathrm{h}_{\mathrm{n}}\left(|\mathrm{y}|^{2}\right) \mathrm{d}|y|^{2}, \tag{11}
\end{equation*}
$$

where

$$
\begin{equation*}
\mathrm{h}_{\mathrm{n}}\left(|y|^{2}\right)=\frac{\pi^{\frac{\mathrm{n}}{2}}}{\Gamma\left(\frac{\mathrm{n}}{2}\right)}\left(|y|^{2}\right)^{\frac{\mathrm{n}-2}{2}|\Delta|^{-\frac{1}{2}} g_{\mathrm{n}}\left(|y|^{2}\right) . . . . . . .} \tag{12}
\end{equation*}
$$

It follows that the equation (12) of Laurent (1974, p. 185), now reads as

$$
\begin{equation*}
\mathrm{Q}_{\mathrm{n}}\left(\mathrm{R}^{2}, \delta^{2}\right)=|\Delta|^{-\frac{1}{2}}\left(\frac{\mathrm{R}}{\delta}\right)^{\frac{\mathrm{n}-2}{2}} \mathrm{R} \int_{0}^{\alpha} \varphi(\mathrm{u}) \frac{\mathrm{J}_{\frac{\mathrm{n}-2}{2}}}{}(\delta \mathrm{u}) \mathrm{Jn}_{\frac{\mathrm{n}}{2}}(\mathrm{Ru}) \mathrm{du}, \tag{13}
\end{equation*}
$$

where from (4)

$$
\begin{equation*}
\varphi(|\mathrm{t}|)=\varphi\left(\sqrt{\mathrm{t}^{\prime} \Delta \mathrm{t}}\right)=\mathrm{K} \int_{0}^{\alpha}|\Delta|^{-\frac{1}{2} \mathrm{f}}(\mathrm{u}) \mathrm{u}^{\frac{\mathrm{n}-2}{2}} \frac{\mathrm{~J}_{\frac{\mathrm{n}-2}{2}}}{}\left(\sqrt{\mathrm{u}} \sqrt{\mathrm{t}^{\prime} \Delta \mathrm{t}}\right) \mathrm{du} . \tag{14}
\end{equation*}
$$

Thus from Laurent (1974, p. 188, equation (24)), we find that

$$
\mu_{\mathrm{n}}=|\Delta|^{-\frac{1}{2}} \int_{0}^{\alpha}\left(\frac{\mathrm{R}}{\delta}\right)^{\frac{\mathrm{n}-2}{2}} \mathrm{R} \int_{\mathrm{S}_{0}} \varphi(\mathrm{u}) \frac{\mathrm{Jn}_{\frac{\mathrm{n}}{2}}^{2}}{}(\delta \mathrm{u}) \frac{\mathrm{Jn}}{\frac{\mathrm{n}}{2}}(\mathrm{Ru}) \mathrm{du} d m .
$$

Now integrating out $m$ over the range $m^{\prime} \Delta m \leq r^{2}$, in the same way as has been done to integrate out $\xi$ we find that

$$
\mu_{\mathrm{n}}=|\Delta|^{-\frac{1}{2}}\left(\frac{2 \pi \mathrm{R}}{|\eta|}\right)^{\frac{\mathrm{n}}{2}} \int_{0}^{\alpha} \varphi(\mathrm{u}) \frac{\mathrm{J}_{\frac{\mathrm{n}}{2}}}{}(\mathrm{Ru}) \frac{\mathrm{J}_{\frac{\mathrm{n}-2}{2}}}{}(|\eta| \mathrm{u}) \frac{\mathrm{J}_{\frac{n}{2}}}{}(\mathrm{ru}) \mathrm{du}
$$

where $|\eta|^{2}=\eta^{\prime} \Delta \eta$.
